The most critical advantage that slightly conical wheels (in trains) have is that they can rotate at slightly different speeds, while cylindrical ones can't (at least not as smoothly as conical ones).. You see, when a conical wheel turns, it slides to the larger part of the cone on the outside wheel and the smaller part on the inside wheel.. The upshot is that that the two wheels still turn ...

You might be surprised to learn that when you turn your car, your front wheels are not pointing in the same direction. For a car to turn smoothly, each wheel must follow a different circle. Since the inside wheel is following a circle with a smaller radius, it is actually making a tighter turn than the outside wheel.
